Average Spot Price by Month — VIC1 (Jun 2025 – Jun 2026)

Average Price by Hour of Day — Peak Window 5–8pm

Spike Count by Month — June 2025 Outage Clearly Dominant

Price vs. Demand — Higher Demand Drives Higher Prices

Quick measure

Feature Importance — Live Risk Model (AUC 0.998)

MODEL LIMITATIONS — READ BEFORE TRUSTING THIS DASHBOARD

- Live Risk model (AUC 0.998) is strong for detecting an IN-PROGRESS price spike, but 83% of its predictive power comes from the previous 5-minute price — this is nowcasting, not advance forecasting.
- A genuine day-ahead forecasting model (using only calendar, demand, and temperature — features known in advance) was tested and achieved AUC 0.94–0.95, but could not reach usable precision at any confidence threshold (best case: 5% precision).
- Likely missing ingredient: generation-side data (wind/solar output, scheduled outages) — not available in this dataset. Flagged as future work.
